Part 1

General Information

1 System Configurations	4
2 Product lineup	5
3 Nomenclature	5
4 System Design and Unit Selection	6

1 System Configurations

Heat pump can be configured to run with the electric heater either enabled or disabled and can also be used in conjunction with an auxiliary heat source such as a boiler.

The chosen configuration affects the size of the heat pump that is required. Three typical configurations are described below.

Configuration 1: Heat pump only

- The heat pump covers the required capacity and no extra heating capacity is necessary.
- Requires selection of larger capacity heat pump and implies higher initial investment.
- Ideal for new construction in projects where energy efficiency is paramount.

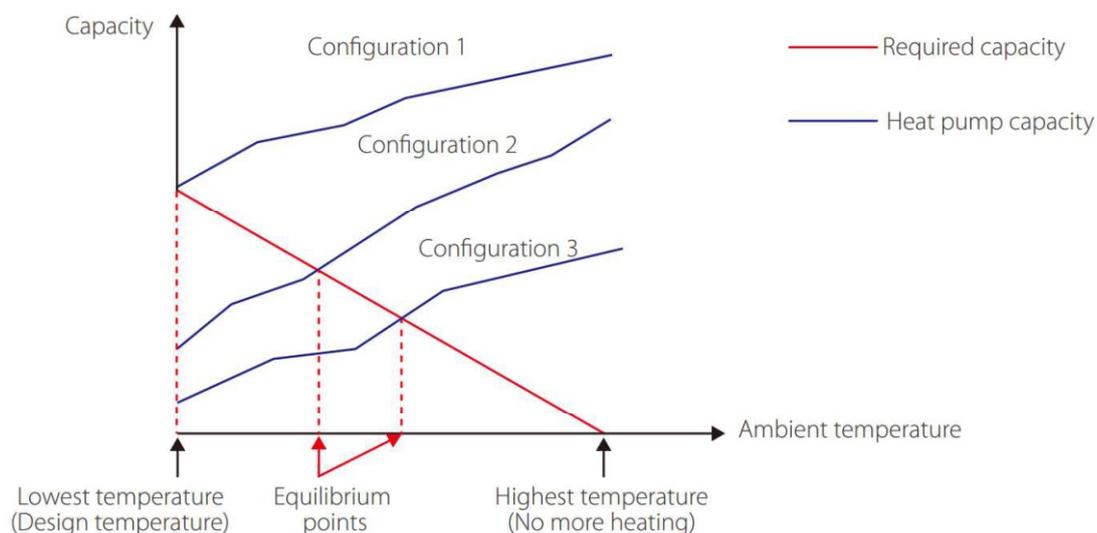

Configuration 2: Heat pump and backup electric heater

- Heat pump covers the required capacity until the ambient temperature drops below the point at which the heat pump is able to provide sufficient capacity. When the ambient temperature is below this equilibrium point, the backup electric heater supplies the required additional heating capacity.
- Best balance between initial investment and running costs, results in lowest lifecycle cost.
- Ideal for new construction.

Configuration 3: Heat pump with auxiliary heat source

- Heat pump covers the required capacity until the ambient temperature drops below the point at which the heat pump is able to provide sufficient capacity. When the ambient temperature is below this equilibrium point, depending on the system settings, either the auxiliary heat source supplies the required additional heating capacity or the heat pump does not run and the auxiliary heat source covers the required capacity.
- Enables selection of lower capacity heat pump.
- Ideal for refurbishments and upgrades.

Figure 1-1.1: System configurations

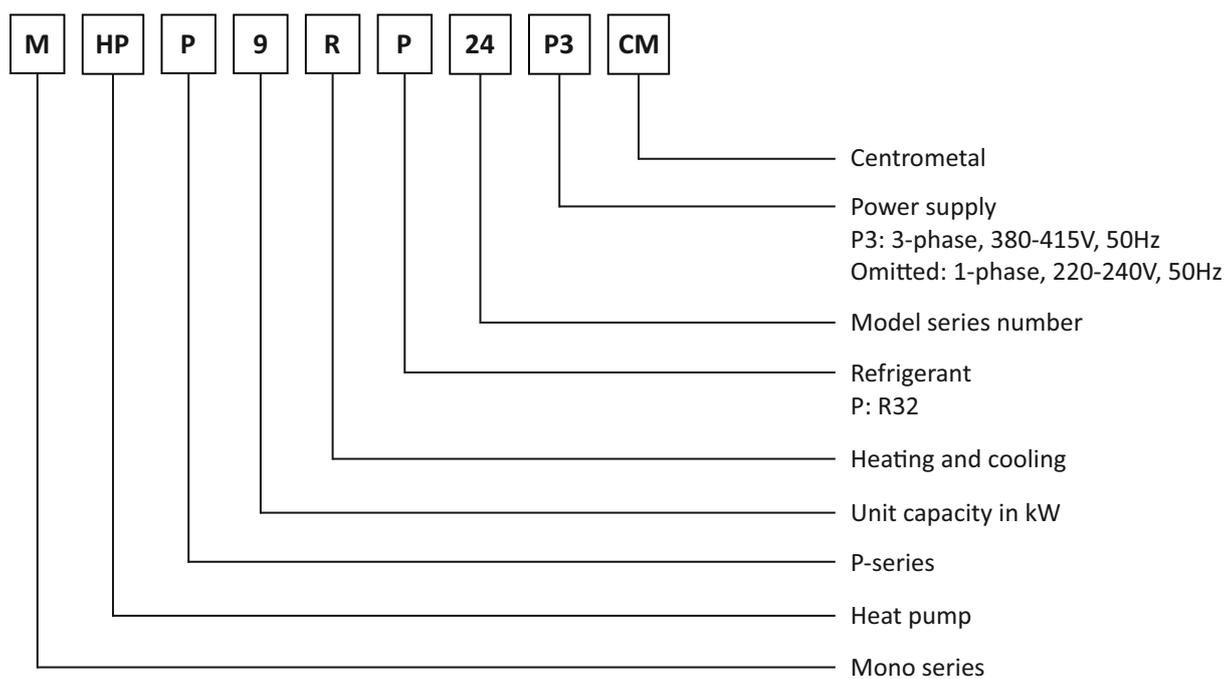

2 Product lineup

Table 1-2.1: Heat pump models

Model	Power supply (V/Ph/Hz)	Refrigerant	Appearance
MHPP5RP24CM	220-240/1/50	R32	
MHPP9RP24CM	220-240/1/50	R32	
MHPP16RP24P3CM	380-415/3/50	R32	

3 Nomenclature

4 System Design and Unit Selection

4.1 Selection Procedure

Step 1: Total heat load calculation

Calculate total heat losses of the building.
Select the heat emitters (type, quantity, water temperature and heat load).

Step 2: System configuration

Decide whether to include AHS and set AHS's switching temperature.
Decide whether backup electric heater is enabled or disabled.

Step 3: Selection of outdoor units

Determine required total heat load on outdoor units.
Set capacity safety factor.
Select power supply.

Provisionally select heat pump unit capacity based on nominal capacity.

Correct capacity of the outdoor units for the following items:
Outdoor air temperature / Outdoor humidity / Water outlet temperature¹ /
Altitude / Anti-freeze fluid.

Is corrected heat pump unit capacity \geq Required total heat load on outdoor units².

Yes

Heat pump system selection is complete.

No

Select a larger model or enable backup electric heater operation.

Notes:

1. If the required water temperatures of the heat emitters are not all the same, the heat pump unit's outlet water temperature setting should be set at the highest of the heat emitter required water temperatures. If the water outlet design temperature falls between two temperatures listed in the outdoor unit's capacity table, calculate corrected capacity by interpolation.
2. If the outdoor unit selection is to be based on total heating load and total cooling load, select Mono units which satisfy not only the total heating load requirements but also the total cooling load requirements.

4.2 Heat Pump Leaving Water Temperature (LWT) Selection

The recommended design LWT ranges for different types of heat emitter are:

- For floor heating: 30 to 35°C;
- For fan coil units: 30 to 45°C;
- For low temperature radiators: 40 to 50°C.

4.3 Optimizing System Design

To get the most comfort with the lowest energy consumption with heat pump, it is important to take account of the following considerations:

- Choose heat emitters that allow the heat pump system to operate at as low a hot water temperature as possible whilst still providing sufficient heating.
- Make sure the correct weather dependency curve is selected to match the installation environment (building structure, climate) as well as ender user's demands.
- Connecting room thermostats (field supplied) to the hydronic system helps prevent excessive space heating by stopping the outdoor unit and circulator pump when the room temperature is above the thermostat set point.

4.4 Selection of the buffer tank and DHW tank

4.4.1 Selection of the buffer tank

The heat pump must be connected to the buffer tank in order to satisfy the minimum amount of water in the system. The volume of the buffer tank must be selected according to table 1-4.1.

Table 1-4.1: Minimum buffer tank volume

Model	Buffer tank [L]
5-9 kW	≥25
16 kW	≥40
Cascade	≥40*n

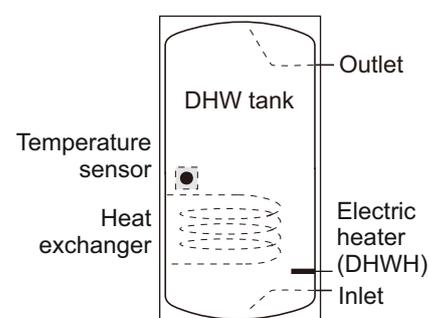

n = number of heat pumps in cascade

4.4.2 Selection of the DHW tank

The heat pump can be connected to the DHW tank. The tank can be with or without a built-in electric heater. The electric heater of the DHW tank must be installed below the tank temperature sensor. The tank temperature sensor must be above the heat exchangers in the tank. For the correct operation of the DHW heating system with a heat pump, it is necessary to comply with the minimum requirements of the DHW tank given in table 1-4.2.

Table 1-4.2: Minimum requirements of the DHW tank

Model		5 kW	9 kW	16 kW
DHW tank volume [L]	Recommended	100-250	150-300	200-500
Heat exchanger area - stainless steel coil [m ²]	Minimum	1,4	1,4	1,6
Heat exchanger area - enamel coil [m ²]	Minimum	2,0	2,0	2,5

4 Operating Limits

Figure 2-4.1: Heating operating limits

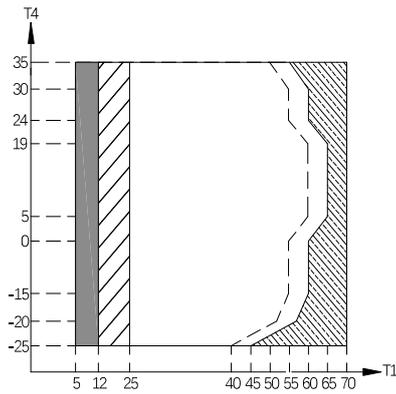

Figure 2-4.2: Cooling operating limits

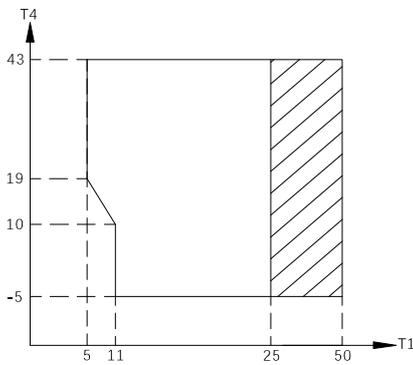

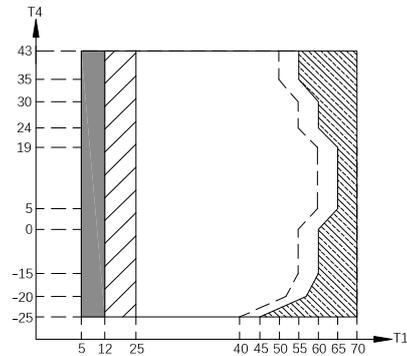

Figure 2-4.3: Domestic hot water operating limits

Abbreviations:

T4: Outdoor temperature (°C)

T1: Leaving water temperature (°C)

IBH: Backup electric heater

AHS: Additional heat source

Notes:

- If IBH/AHS setting is valid, only IBH/AHS turns on;
If IBH/AHS setting is invalid, only heat pump turns on, limitation and protection may occur.
- ▨ Heat pump turns off, only IBH/AHS turns on.
(IBH can heat the water temperature up to 65°C, AHS can heat the water temperature up to 70°C)
- ▩ Operation range by heat pump with possible limitation and protection.
- - - Maximum inlet water temperature line for heat pump operation.

6 Hydronic Performance

Figure 2-6.1: **MHPP5RP24CM / MHPP9RP24CM** hydronic performance

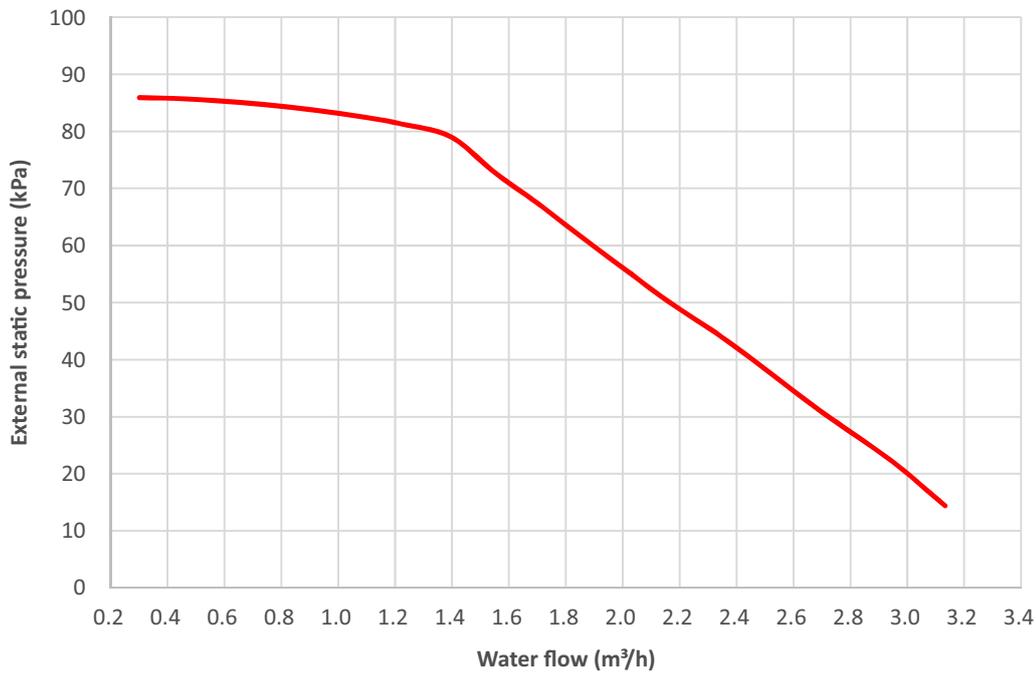

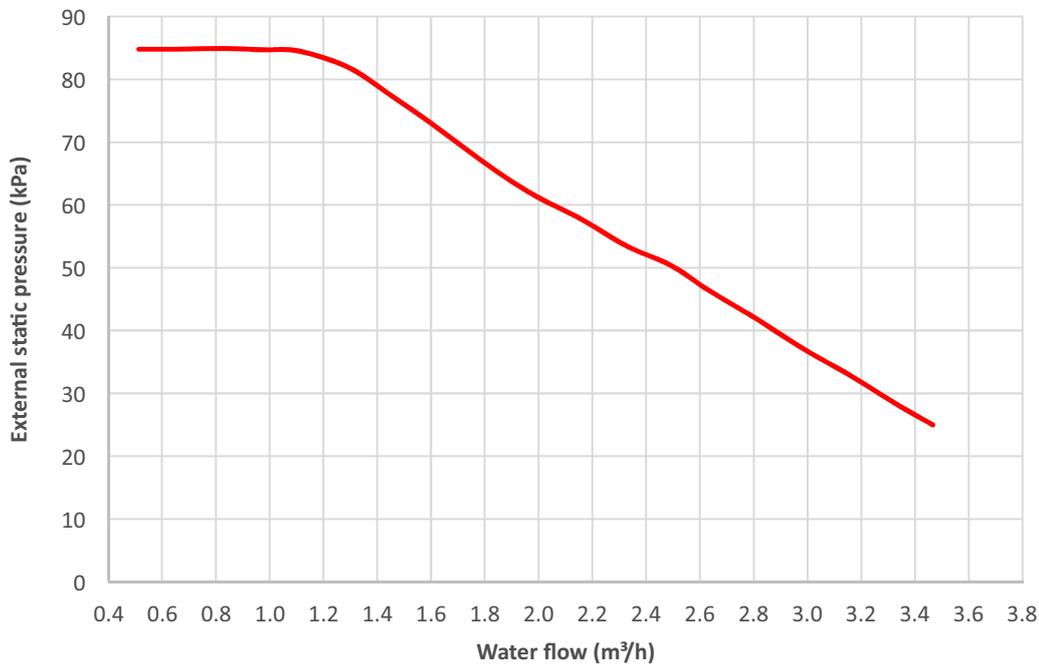

Figure 2-6.2: **MHPP16RP24P3CM** hydronic performance

7 Sound Levels

7.1 Overall

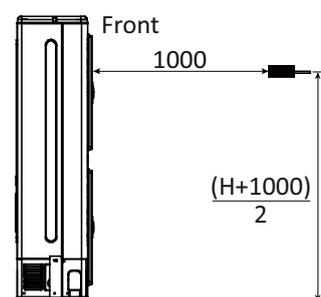

Table 2-7.1: Sound pressure levels¹

Model name	dB(A) ²
MHPP5RP24CM	48
MHPP9RP24CM	53
MHPP16RP24P3CM	59

Notes:

1. Sound pressure level is measured at a position 1m in front of the unit and $(1+H)/2$ m (where H is the height of the unit) above the floor in a semi-anechoic chamber. During in-situ operation, sound pressure levels may be higher as a result of ambient noise.

Figure 2-7.1: Sound pressure level measurement (unit: mm)

2. dB(A) is the maximum value tested under the conditions below:

Outdoor air temperature 7°C DB, 6°C WB; EWT 30°C, LWT 35°C. Free compressor frequency.

Outdoor air temperature 7°C DB, 6°C WB; EWT 47°C, LWT 55°C. Free compressor frequency.

7.2 Octave Band Levels (NR)

Figure 2-7.2: MHPP5RP24CM octave band levels

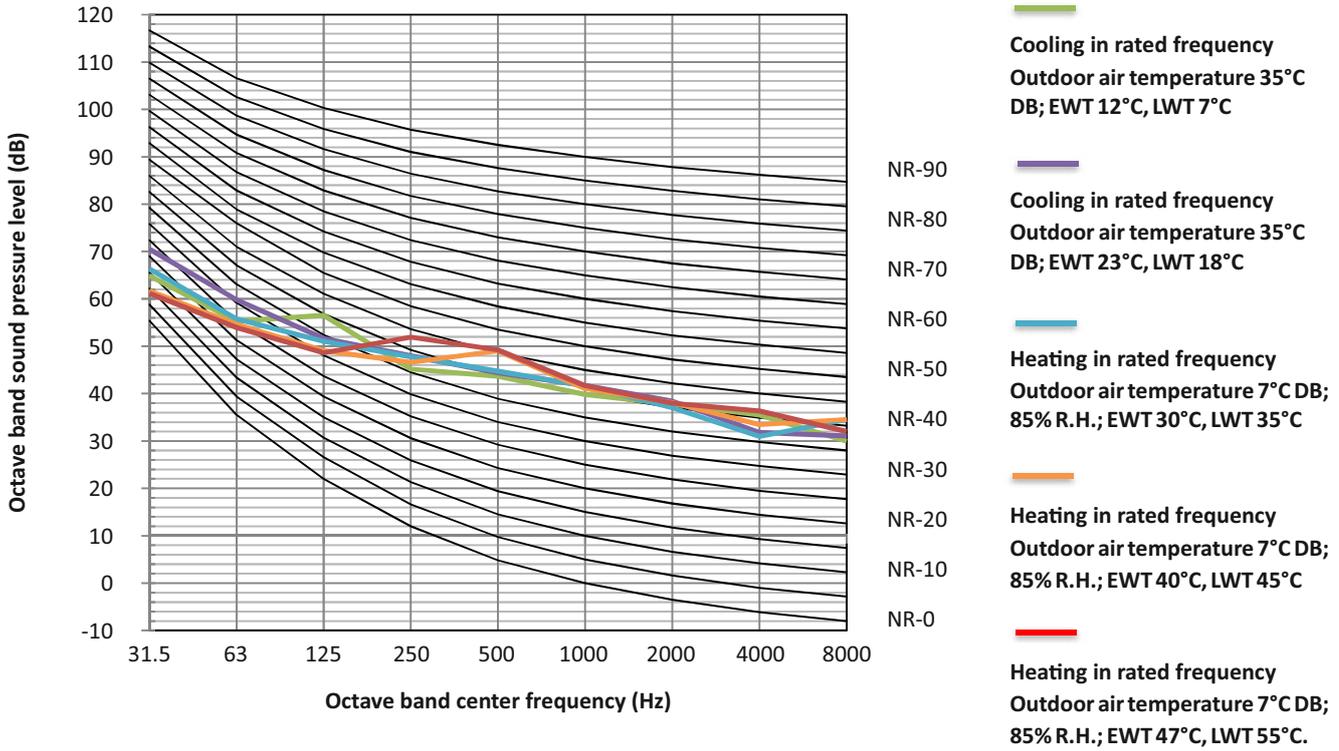

Figure 2-7.3: MHPP9RP24CM octave band levels

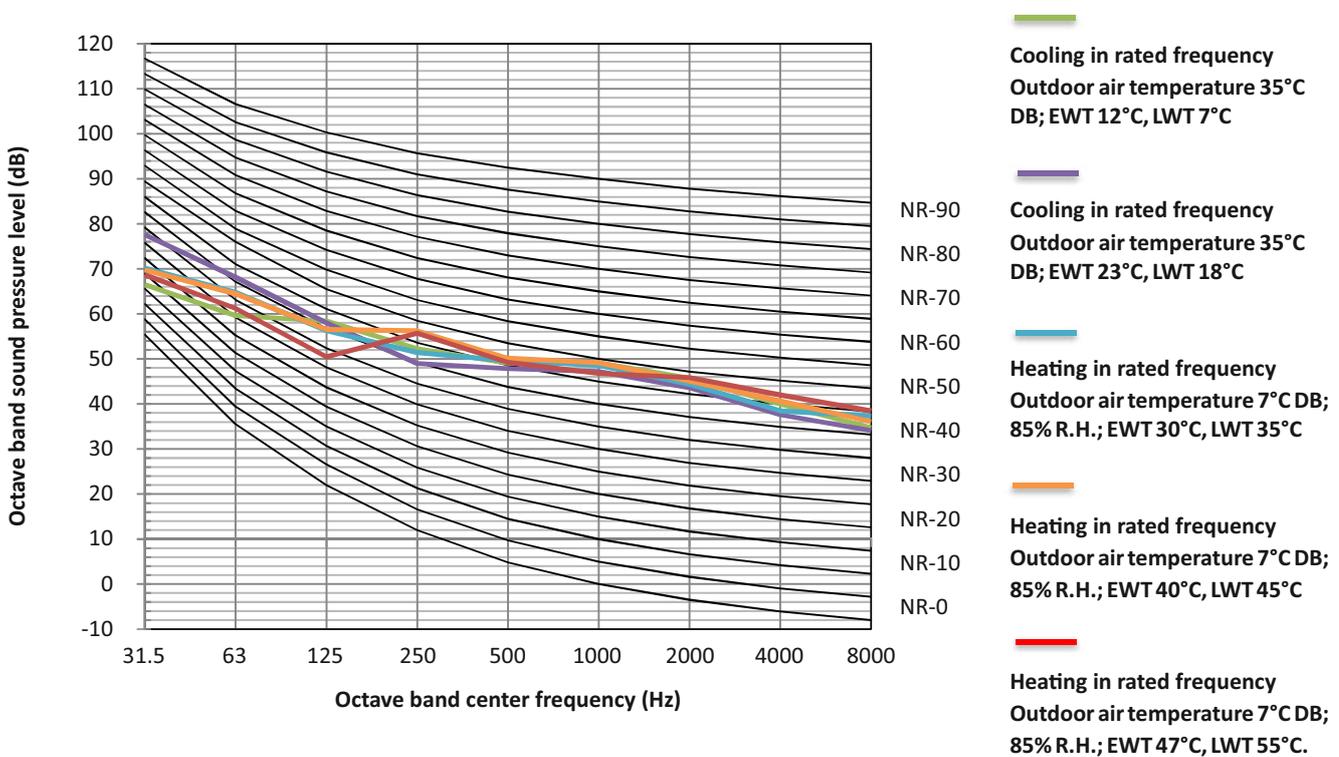

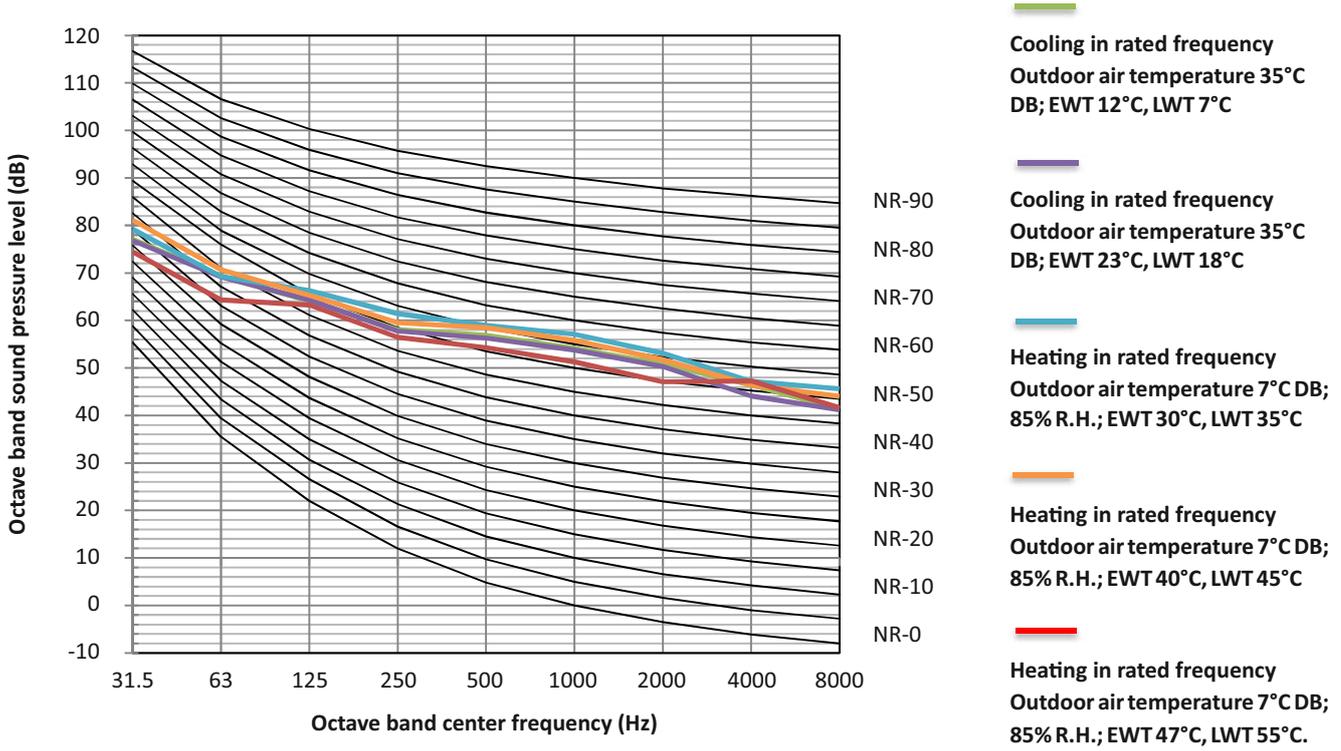

Figure 2-7.4: MHPP16RP24P3CM octave band levels
